FUNCTION: THE RAT SEMINAL VESICLE CONTAINS SIX MAJOR ANDROGEN-
DEPENDENT SECRETORY PROTEINS REFERRED TO AS SVS I-VI. THE SVS
I-III PROTEINS APPEAR TO BE COMPONENTS OF THE RAT COPULATORY
PLUG, WITH THE SVS II PROTEIN BEING THE MAJOR COMPONENT.

SUBUNIT: COMPONENT OF NUCLEAR RIBOPROTEIN COMPLEXES.

SUBCELLULAR LOCATION: NUCLEAR.

TISSUE SPECIFICITY: UBIQUITOUS.

ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG ISOFORM (SHOWN HERE)
AND A SHORT ISOFORM; ARE PRODUCED BY ALTERNATIVE SPLICING.

DISEASE: A FORM OF MALIGNANT MYXOID LIPOSARCOMA IS CHARACTERIZED BY A CHROMOSOMAL TRANSLOCATION T(12;16)(Q13;P11) THAT INVOLVES FU

```

```
C; Function:
A; Description: RNA binding; probable plays a role in transcript.
A; Description: RNA-binding protein EWS; ribonucleoprotein repeat
C; Superfamily: RNA-binding protein EWS; RNA binding; tandem repeat
C; Keywords: carcinogenesis; nucleus; RNA binding; tandem repeat
F; 286-361/Domain: ribonucleoprotein repeat homology <RRM>
                                                                                                                                                                                                                                gonadotropin-releasing hormone - Cichlid (Haplochromis burtoni)

Chimeric protein of leukotoxin and gonadotropin releasing hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       repeat units are separated by spacers designed to increase immunogenicity. The DNA sequence was incoporated into vector pAA352 (ATCC 68283), which contains a truncated leukotoxin gene (LKT 352) derived from Pasteurella haemolytica, to give plasmid pCB113 (T37176). Escherichia cooli transformants produce an LKT-GRH fusion protein (see also W03942 and W03943) useful as a vaccine for fertility control of domestic or farm ar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gonadotropin-releasing hormone multimer fusion proteins - with leukotoxin polypeptide for increased immunogenicity, useful in antifertility vaccine prodn.

This sequence, as compared to the native peptide, has beer found to have an N-terminal Gln rather than a pyroGlu residue, and also contains substitutions at amino acid residues 15 and 41, whereby His is replaced by Asp. This produces an alternating multimeric GnRH sequence which is highly immunogenic that can be used in the construction of a chimeric protein that comprises a leukotoxin polypeptide, several multimers, and the GnRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of mammary tumours in a mammalian
                                                          Immunisation against endogenous molecules by administering to ear - useful to elicit efficient and uniform immune responsist e.g. gonadotrophin releasing hormone to immunocastration
                                                                                                                                                                                                                                                                                                                                                                                                                      GnRH; gonadotrophin releasing hormone peptide hormone; leukotoxin; immunisation; endogenous molecule; vaccine; ear; immunogen; carrier; immune response; hormone receptor; cancerous cell; domestic animal; porcine; bovine; luteinizing hormone; follicle stimulating hormone;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a recombinantly produced or chemically synthesised Gonadotropin releasing hormone 2 (GnHR-2) polypeptide, which contains four copies of the GnHR decapeptide (V61528) and triplet amino acid spacers between each of these sequences. This decapeptide is secreted naturally by the hypothalamus which controls release of both the luteinising hormone (LH) and the follicle stimulating hormone (FSH) in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     useful for, e.g. preparation of vaccines for reduction of incidence of mammary tumours in mammals % \left( 1\right) =\left\{ 1\right\}

CC This represents the amino acid sequence of the gonadotrophin releasing CC hormone (GnRH-2) decapeptide fragment used in the chimeric leukotoxin-CC GnRH polypeptide gene fusions. This is used to exemplify the method of CC invention of immunisation against endogenous molecules by administering CC a vaccine which comprises an immunogen and a carrier to the ear of the CC mammal. The method is useful for eliciting an efficient and uniform CC immune response to block or suppress the activity of an endogenous CC hormone, hormone receptor, agonist or antagonist in a vaccinated subject, CC or to elicit an immune response against a targeted endogenous cell type CC (e.g. a cancerous or otherwise diseased cell). It is especially useful to reduce the levels of GnRH in domestic animals, especially in porcine CC revels of luteinizing hormone and follicle stimulating hormone and helps CC in immunocastrating the animal. Administration into the neck increases CC the ear instead of intramuscular administration into the neck increases CC and may increase uniformity of vaccine presentation since the ear is
uniform from animal to animal.

Hormone immunogens, analogues or antibodies used to manufacture vaccines for suppression of reproductive behavior and fertility 'n

Claim Fig 5B; English

This sequence represents a four-copy gonadotropin-releasing hormone (GnRH) multimer, where the second and fourth GnRH shave a His to Asp substitution at position 2 of the GnRh se The invention relates to GnRH immunogens, analogues or anti of the GnRH sequence.

This sequence represents four copies of a gonadotropin releasing hormone (GnRH) analogue, DNA encoding which was used in the construction of a chimeric GnRH-leukotoxin (LKT) fusion gene (246400). This fusion gene encodes a GnRH-LKT fusion

The LKT portion of the protein acts to enhance the immunogenicity of the GnRH portion. The invention relates to a method of using two GnRH immunogen vaccines to produce uncastrated male animals for meat production, one vaccination prior to or during the fattening period to reduce Circulating testosterone levels, and the second vaccination about 2-8 weeks before slaughter to substantially reduce androgenic and/or non-androgenic steroids. The invention is used to produce food animals that exhibit the weight gain and muscle/fat distribution of male animals without the problems associated with male animals. Such problems include "boar taint", a urine-like odour found in cooked meat of uncastrated pigs which is caused by steroids stored in the tissues, and similar flavour impairments in the meat of other intact male animals. The invention is

It is the product of a chimeric gene (T37177) produced by deleting an approx. 1300 bp sequence from pCB113 (see also T37176) coding for amino acids 352-784 of LKT-352. Recombinant plasmid pCB111 (LKT 111:4 copy GnRH, ATCC 69748) was obtd. Escherichia coli transformants produced the chimeric protein, which is useful as a vaccine for fertility control, esp. immunological sterilisation of domestic or farm
                                              which enables there to be an increase in antigen presentation and thus an optimal immune response. The removal of this region also enables the truncated LKT to be expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a leukotoxin polypeptide, several multimers, and a GnRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of
                                                                                                                                                                                                                                                 Chimeric protein of leukotoxin and gonadotropin releasing useful for, e.g. preparation of vaccines for reduction of of mammary tumours in mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimera; pCB111; LKT 111; GnRH; Gonadotropin releasing hormone; multimer; cytotoxic activity; antigen presentation; immune response; vaccine;

                                                                                                                                                                                                           The present sequence represents the LKT-GnRH chimeric protein from pCB122. This plasmid contains the LKT 111 polypeptide fused to sixteen copies of the GnRH peptide, in the pattern of: 8 copies of GnRH. This chimera lacks cytotoxic activity which enables there to be an increase in antigen presentation and thus an optimal immune response. The removal of this region also enables the truncated LKT to be expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a leukotoxin polypeptide, several multimers, and a GnRH sequence. The chimeric protein can be used as a vaccine to help reduce the incidence of

CC releasing hormone (GnRH) immunogens and a Pasteurella
CC haemolytica leukotoxin (LKT) protein. The fusion protein comprises, in
CC the N to C-terminal direction, a synthetic peptide sequence (Y58364), an
CC eight copy GnRH multimer (composed of two copies of the 4xGnRH multimer
CC sequence of Y58363), the LKT protein (which functions as a carrier
CC protein), and a second eight copy GnRH multimer. The fusion protein may
CC vertebrate subject to result in prolonged suppression of reproductive
CC behaviour and/or fertility. GnRH immunogens, analogues or antibodies
CC that cross-react with endogenous GnRH of a vertebrate subject are used
CC to manufacture a composition or vaccine for immunosterilisation or
CC immunocontraception of feline, canine, equine or cervine subjects.
CC The vaccines are used to suppress reproductive behaviour and/or
CC results in a prolonged, long-term suppression of cresults in a prolonged, long-term suppression of covarian development and/or function in males, or a prolonged, long-term suppression of covarian development and/or function in females. The methods provide a
CC viable and desirable alternative to surgical forms of sterilisation that

                                                                                                                                                                                                                                                                                                                                               uncastrated male animals for meat production, one vaccination prior to or during the fattening period to reduce circulating testosterone levels, and the second vaccination about 2-8 weeks before slaughter to substantially reduce androgenic and/or non-androgenic steroids. The invention is used to produce food animals that exhibit the weight gain and muscle/fat distribution of male animals without the problems associated with male animals. Such problems include "boar taint", a urine-like odour found in cooked meat of uncastrated pigs which is caused by steroids stored in the tissues, and similar flavour impairments in the meat of other intact male animals. The invention is more reliable than prior art immunocastration techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gonadotropin releasing hormone; GnRH; leukotoxin; LRT; fusion protein antibody; immunogenic; chimeric; vaccine; testosterone; androgenic; non-androgenic; steroid; reduction; weight gain; muscle distribution; fat distribution; male pattern; boar taint; flavour; impairment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a chimeric gonadotropin releasing hormone (GnRH)-leukotoxin (LKT) fusion protein, which may be used as a vaccine. The LKT portion of the protein acts to enhance the immunogenicity of the multimeric GnRH portion (Y58135). The invertelates to a method of using two GnRH immunogen vaccines to produce

It is the product of a chimeric gene (T37176) produced by ligating a synthetic sequence for the 4-copy GnRH into vector pAA352 (ATCC 68283), which carrie the LKT-352 gene. Recombinant plasmid pCBH13 (LKT 352:4 copy GnRH, ATCC 69749) was obtd. Escherichia coli transformants produced the chimeric protein, which is useful as a vaccine for trillty control can be a succine for the control can be control of the chimeric protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gonadotropin-releasing hormone multimer fusion proteins - with leukotoxin polypeptide for increased immunogenicity, useful in antifertility vaccine prodn.

This plasmid contains the LKT 352 polypeptide (W79568) fused to four copies of the GnRH peptide. This chimera lacks cytotoxic activity which enables there to be an increase in antigen presentation and thus an optimal immune response. The removal of this region also enables the truncated LKT to be expressed at much higher levels and allows the amount of antigen administered to be reduced. This chimeric protein comprises a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric protein of leukotoxin and gonadotropin releasing useful for, e.g. preparation of vaccines for reduction of of mammary tumours in mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure;

```
ability to stimulate an anti-self response provides a simple alternative Ct to physical castration. Immunocastration of pigs is a better alternative to physical castration, as it does not result in any of the detrimental side effects associated with physical castration. Other examples of Ct diseases and conditions treated with self proteins fused with ubiquitin Ct are TNF and its epitopes to modulate septic shock, arthritis, Iq control neavy chain for the control of allergic reactions; chorionic control. A further use of the fusion proteins for fertility control. A further use of the fusion proteins is as part of a vaccine to enhance growth rate and thereby the final weight of the livestock prior can be used to detect and identify antibodies from experimental samples. This sequence represents a GRHH fragment used in the construction of
                                                                                                                                                                                                                                                                                                                                                                                                 used as vaccines to induce an immune response. When a T cell epitope is attached, they can be used for control of viral infections, bacterial infections, parasitic infection and cancer. The fusion proteins can be used in pharmaceutical compositions for the treatment of gastrointestinal diseases, pulmonary inflections, respiratory inflections, and HIV infections. The use of ubiquitin as a scaffold is also useful for the presentation and stimulation of anti-self immune responses, e.g. generation of anti-gonadotropin releasing hormone antibodies which result in the suppression of luteinizing hormone and follicle stimulation hormone. This indirectly suppresses steridogenesis and gamete maturation in males and females. This type of anti-self response in humans is useful in the treatment of prograture concerned beauty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           when administered to an animal. The protein of the invention may be post-translationally modified (e.g. by the addition of fatty acids to enhance immunogenicity). The fusion proteins of the invention can be
Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CY This invention describes a novel fusion protein, comprising a heat shock comprotein (e.g. ubiquitin), fused to an epitope(s) in a defined manner combinated (e.g. which is useful for the stimulation of a highly specific immune response combined and ministered to an animal. The protein of the invention may be composited to the invention may be composited (e.g. by the addition of fatty acids to composite immune response. When a T cell epitope is considered they can be used for control of viral infections, bacterial confections, parasitic infection and cancer. The fusion proteins can be used in pharmaceutical compositions for the treatment of gastrointestinal confections. The use of thiquitin as a scaffold is also useful for the consensation and stimulation of anti-self immune responses, e.g. consensation and stimulation of anti-self immune responses, e.g. consensation. This indirectly suppresses steridogenesis and gamete maturation compositions. This indirectly suppresses steridogenesis and gamete maturation in the suppression of luteinizing hormone and follicle stimulating commone. This indirectly suppresses steridogenesis and gamete maturation ability to stimulate an anti-self response provides a simple alternative complysical castration, as it does not result in any of the detrimental composition heavy chain for the control of allergic reactions; chorionic constitution heavy chain for the control of allergic reactions; chorionic control. A further use of the fusion proteins fused with bloquitin control. A further use of the fusion proteins is a spart of a vaccine to shipment to market. In addition, the fusion proteins of the invention of the sequence represents a Gamet fragment used in the construction of the control of an abiquitin fusion protein described in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       plasmid pBTA859 is a TraTp-LHRH analogue fusion in which 8 copies of an LHRH analogue have been inserted between amino acids 200 and 201 of TraTp (Ogata R.T. et al., (1982) J.Bacteriol. 151:819-827). The plasmid was constructed by two successive additions of DNA coding for a dimer of LHRH analogue into the Smal site of pBTA862 (see Q11020) which all ready carries four copies of the LHRH sequence. After transformation, colonies with 8 LHRH molecules were identified. Fusion proteins with multiple inserts generated a higher anti-LHRH response (as measured by the binding of (125)I-LHRH at a serum dilution of 1:2000 final) than constructs with a single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fusion proteins comprising LHRH analogue and TraTp (analogue) useful in vaccine for inhibition or control of reproduction in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          07-MAR-1991.
